JACOBS BAYMAX

Day 03

Year-one success checklist

R0.2 | 27 October 2026 | Accountable owner: Faisal Farouq

Future targets. Actual robot tests: NOT EXECUTED.

Metric	Target	Method and evidence to collect later
Height **JB-R-002**	**1.829 m**	Measure sole-to-crown in the approved supported reference configuration. Save the configuration, instrument/calibration reference, actual reading and photo.
Operating mass **JB-R-003**	**At most 55 kg**	Weigh each permitted operating configuration on a calibrated scale. Include battery, panels and attached handling module. Retain the reading and configuration inventory.
Lower-body joints **JB-R-005**	**10 active joints**	Cross-check the joint register, CAD tree, simulation tree, controller mapping and later as-built inspection. Count passive joints separately.
Walking speed **JB-R-007**	**0.10-0.15 m/s**	For each trial, divide measured pelvis displacement by elapsed time over the defined three-step interval. Retain synchronized video, contact/position logs and uncertainty.
Step sequences **JB-R-006**	**3 alternating steps in each of 2 trials**	Count L-R-L or R-L-R using video and foot-contact logs. Give each trial its own ID and result. Retain support-load, stop and reviewer records.
Object handling **JB-R-040 to 042**	**2 kg inert object 10 supervised reps**	Use a stationary, mechanically secured configuration and an approved trajectory. Retain payload measurement, repetition IDs, position/current/temperature/force logs and stops.

Day 3 document check: PASS

The full CSV has 10 metric rows, including the two mass-review triggers. Every row has a numeric target, a unit or count, a measurement method, required evidence, source references and visible limitations.

Your reported time: 2 hours (120 minutes). This is the total for Day 3, not time per checklist row. **Prepared by:** Codex, AI documentation and planning assistant.

This PASS covers the checklist document. It does not release a gate, certify safety or establish robot performance. No physical test was run and no spending was committed.

Day 03

Evidence and open decisions

R0.2 | 27 October 2026 | Accountable owner: Faisal Farouq

Future targets. Actual robot tests: NOT EXECUTED.

Two trials means two separate records

Each supervised tethered trial must contain three alternating consecutive steps. Record each trial's measured speed, tether assistance, stops and limitations. An arrest catch, external propulsion or operator stabilization does not establish successful gait. Six steps combined across attempts do not replace the two required three-step trials.

Handling stays separate from walking

Handling uses a 2 kg inert object while the robot is stationary and mechanically secured, for 10 supervised complete repetitions. The approved protocol must define the trajectory, start/end points, mass tolerance, support/retention, instrumentation and limits. No walking with the test payload and no person lifting or support.

Keep these decisions open

Height tolerance	1.829 m is the target. The R0.1 band of 1.809-1.849 m is provisional; older local charters use +/-0.010 m. No tolerance is selected today.
Mass escalation	A projection above 55 kg requires rework. Above 65 kg requires a major review and suspension of affected purchases/motion releases. Neither threshold is a measured mass or extra operating allowance.
Joint layout	Ten active lower-body joints is the target count. The exact arrangement remains open under D-03.
Handling envelope	Reach, trajectory, payload tolerance, support design and operating limits remain open under D-04. No lift height is adopted here.
Resources and workflow	Funding/feasibility (D-01), facility and qualified people (D-02), and fictional workflow/approved recipient (D-05) remain unresolved.

Sources and record

R0.1 mission and engineering baseline: 2026-10-23. Requirements: JB-R-002 to 007 and JB-R-040 to 042. Verification records: JB-V-02, 03, 04, 05 and 22. Day 002 folder index: R0.2, 2026-10-25. Source fingerprints and completion checks are retained in the evidence record.
